Maximal Independent Sets in Clique-free Graphs

Sam Spiro, Rutgers University.

Joint with Xiaoyu He and Jiaxi Nie

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

A maximal independent set (MIS) is an independent set $I \subseteq V(G)$ which is maximal with respect to set inclusion.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Let m(n) denote the maximum number of MIS's in an *n*-vertex graph.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Let m(n) denote the maximum number of MIS's in an *n*-vertex graph.

Theorem (Miller, Muller 1960; Moon, Moser 1965)

If $n \ge 2$, then

$$m(n) = \begin{cases} 3^{n/3} & n \equiv 0 \mod 3, \\ 4 \cdot 3^{(n-4)/3} & n \equiv 1 \mod 3, \\ 2 \cdot 3^{(n-2)/3} & n \equiv 2 \mod 3. \end{cases}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Let $m_3(n)$ denote the maximum number of MIS's in an *n*-vertex triangle-free graph.

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

Let $m_3(n)$ denote the maximum number of MIS's in an *n*-vertex triangle-free graph.

Theorem (Hujter, Tuza 1993)

If $n \ge 4$, then

$$m_3(n) = \begin{cases} 2^{n/2} & n \equiv 0 \mod 2, \\ 5 \cdot 2^{(n-5)/2} & n \equiv 1 \mod 2. \end{cases}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Let m(n, k) denote the maximum number of MIS's of size k that an *n*-vertex graph can have.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Let m(n, k) denote the maximum number of MIS's of size k that an *n*-vertex graph can have.

Theorem (Nielsen 2002)

If $s \in \{0, 1, \dots, k-1\}$ with $n \equiv s \mod k$, then

$$m(n,k) = \lfloor n/k \rfloor^{k-s} \lceil n/k \rceil^s$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Define $m_t(n, k)$ to be the maximum number of k-MIS's that an *n*-vertex K_t -free graph can have.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Define $m_t(n, k)$ to be the maximum number of k-MIS's that an *n*-vertex K_t -free graph can have. Given the previous constructions, we might expect that the maximizer for $m_t(n, k)$ will consist of the disjoint union of some "nice" graphs.

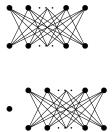

Define $m_t(n, k)$ to be the maximum number of k-MIS's that an *n*-vertex K_t -free graph can have. Given the previous constructions, we might expect that the maximizer for $m_t(n, k)$ will consist of the disjoint union of some "nice" graphs. One reasonable construction is a *comatching*.

$$m_3(n,2) = \Omega(n)$$

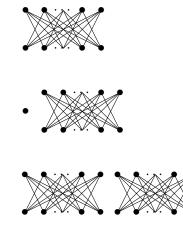

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

 $m_3(n,2) = \Omega(n)$

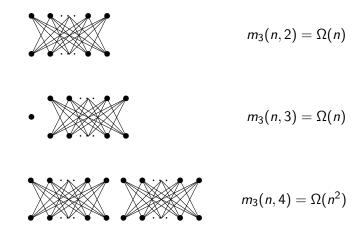

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

$$m_3(n,2) = \Omega(n)$$

$$m_3(n,3)=\Omega(n)$$

More generally this shows $m_t(n, k) = \Omega(n^{\lfloor k/2 \rfloor})$ for fixed k.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Reasonable Question

Is it the case that for all k, t we have

$$m_t(n,k) = O_{k,t}(n^{\lfloor k/2 \rfloor}).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Reasonable Question

Is it the case that for all k, t we have

$$m_t(n,k) = O_{k,t}(n^{\lfloor k/2 \rfloor}).$$

Theorem (He, Nie, S. 2021)

For $n \ge 8$ we have

$$m_3(n,2) = \lfloor n/2 \rfloor,$$

and the unique graph achieving this bound is a comatching of order *n*.

Reasonable Question

Is it the case that for all k, t we have

$$m_t(n,k) = O_{k,t}(n^{\lfloor k/2 \rfloor}).$$

Theorem (He, Nie, S. 2021)

For $n \ge 8$ we have

$$m_3(n,2) = \lfloor n/2 \rfloor,$$

and the unique graph achieving this bound is a comatching of order n. Moreover, we have

$$m_3(n,3) = \Theta(n),$$

 $m_3(n,4) = \Theta(n^2).$

Proposition

For all $t \ge 4$, $m_t(n,3) \ge n^{2-o(1)}$.

Proposition

For all $t \geq 4$,

$$m_t(n,3)\geq n^{2-o(1)}.$$

Ruzsa-Szemerédi: there exists an *n*-vertex tripartite graph G on $U \cup V \cup W$ with $n^{2-o(1)}$ edges such that every edge is contained in a unique triangle.

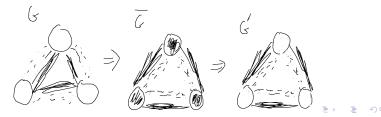

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Proposition

For all $t \geq 4$,

$$m_t(n,3) \ge n^{2-o(1)}.$$

Ruzsa-Szemerédi: there exists an *n*-vertex tripartite graph *G* on $U \cup V \cup W$ with $n^{2-o(1)}$ edges such that every edge is contained in a unique triangle. Let *G'* be the "tripartite complement" of *G*, i.e. take the complement \overline{G} and then delete all the edges within each of the parts U, V, W.

(日)

э

Claim: every triangle $T = \{u, v, w\}$ in G is a 3-MIS in G'.

Claim: every triangle $T = \{u, v, w\}$ in G is a 3-MIS in G'. Since G contains $n^{2-o(1)}$ triangles, and since the tripartite graph G' is K_t -free for $t \ge 4$, we conclude the result.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Using generalization of the Ruzsa-Szemerédi construction due to Gowers and Janzer gives:

Theorem (He, Nie, S. 2021)

For all fixed k, t, we have

$$m_t(n,k) \geq n^{\left\lfloor \frac{(t-2)k}{t-1}
ight
floor -o(1)}.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Using generalization of the Ruzsa-Szemerédi construction due to Gowers and Janzer gives:

Theorem (He, Nie, S. 2021)

For all fixed k, t, we have

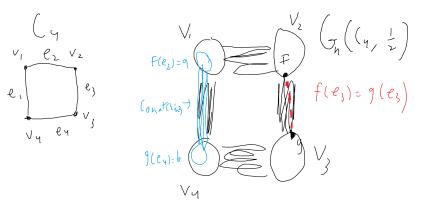

$$m_t(n,k) \geq n^{\left\lfloor \frac{(t-2)k}{t-1} \right\rfloor - o(1)}.$$

Reasonable Question

Is this bound essentially tight? In particular, for triangle-free graphs do we have

$$m_3(n,k) = \Theta(n^{\lfloor k/2 \rfloor}).$$

Better Construction: Blowups

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

For all $k \ge 4$,

$$m_3(n,k) = \Omega(n^{k/2}).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

For all $k \geq 4$,

$$m_3(n,k) = \Omega(n^{k/2}).$$

One can generalize this construction by taking blowups of arbitrary triangle-free graphs.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

For all $k \geq 4$,

$$m_3(n,k) = \Omega(n^{k/2}).$$

One can generalize this construction by taking blowups of arbitrary triangle-free graphs. One can also generalize it to hypergraphs (using interwoven copies of Rusza-Szemerédi type constructions).

For all $k \geq 4$,

$$m_3(n,k) = \Omega(n^{k/2}).$$

One can generalize this construction by taking blowups of arbitrary triangle-free graphs. One can also generalize it to hypergraphs (using interwoven copies of Rusza-Szemerédi type constructions).

Theorem (He, Nie, S. 2021)

 $t \geq 3$ and $k \geq 2(t-1)$, then

$$m_t(n,k) \geq n^{\frac{(t-2)k}{t-1}-o(1)}$$

We think these lower bounds are essentially best possible:

Conjecture (He, Nie, S.; S.)

For all fixed k, t, we have

$$m_t(n,k) = O(n^{\frac{(t-2)k}{t-1}}).$$

Moreover, for k < 2(t-1) we have

$$m_t(n,k) = O(n^{\left\lfloor \frac{(t-2)k}{t-1} \right\rfloor}).$$

Upper Bounds

Proposition

For all k < t we have

$$m_t(n,k) = O(n^{\left\lfloor \frac{(t-2)k}{t-1} \right\rfloor}) = O(n^{k-1}).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Upper Bounds

Proposition

For all k < t we have

$$m_t(n,k) = O(n^{\left\lfloor \frac{(t-2)k}{t-1} \right\rfloor}) = O(n^{k-1}).$$

Theorem (He, Nie, S. 2021)

For all $k \leq 4$, we have

$$m_3(n,k) = O(n^{\lfloor k/2 \rfloor}).$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Conjecture

$$m_3(n,5) = \Theta(n^{5/2}).$$

▲□▶▲圖▶▲≣▶▲≣▶ ≣ めぬぐ

Proposition (He, Nie, S. 2021)

If G is an n-vertex graph which is the subgraph of a blowup of C_5 , then it contains at most $O(n^{5/2})$ 5-MIS's.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Proposition (He, Nie, S. 2021)

If G is an n-vertex graph which is the subgraph of a blowup of C_5 , then it contains at most $O(n^{5/2})$ 5-MIS's.

Conjecture

If G is an n-vertex subgraph of a blowup of a k-vertex triangle-free graph H, then G contains at most $O(n^{k/2})$ k-MIS's.

Question

Are the o(1) terms in our exponents necessary when $t \ge 4$? In particular, is it true that

$$m_4(n,3) = n^{2-o(1)}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Question

Are the o(1) terms in our exponents necessary when $t \ge 4$? In particular, is it true that

$$m_4(n,3) = n^{2-o(1)}$$

Proposition

If G is an n-vertex tripartite graph, then G has at most $n^{2-o(1)}$ 3-MIS's.

Question

If G is an *n*-vertex K_4 -free graph with "many" k-MIS's, is it true that G has chromatic number $O_k(1)$?

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Question

If G is an *n*-vertex K_4 -free graph with "many" k-MIS's, is it true that G has chromatic number $O_k(1)$?

Note that for K_3 -free graphs it is easy to prove that if G has at least 1 k-MIS, then $\chi(G) \le k + 1$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Proposition

If n is even and $2n/5 \le k \le n/2$, then

$$m_3(n,k) \ge (25/32)^{k-n/2} 2^{n/2}.$$

The classical functions m(n), m₃(n), m(n, k) have relatively simple answers, but combining them into m_t(n, k) seems to give a much more complex problem.
